Anatomy

Pathology and interpretation

I do not have an affiliation, financial or otherwise, with a pharmaceutical company, medical device or communications organization

I have no conflicts of interest to disclose (i.e. no industry funding received or other commercial relationships)

I have no financial relationship or advisory role with pharmaceutical or device-making companies, or CME provider

I will not discuss or describe in my presentation at the meeting the investigational or unlabeled ("off-label") use of a medical device, product, or pharmaceutical

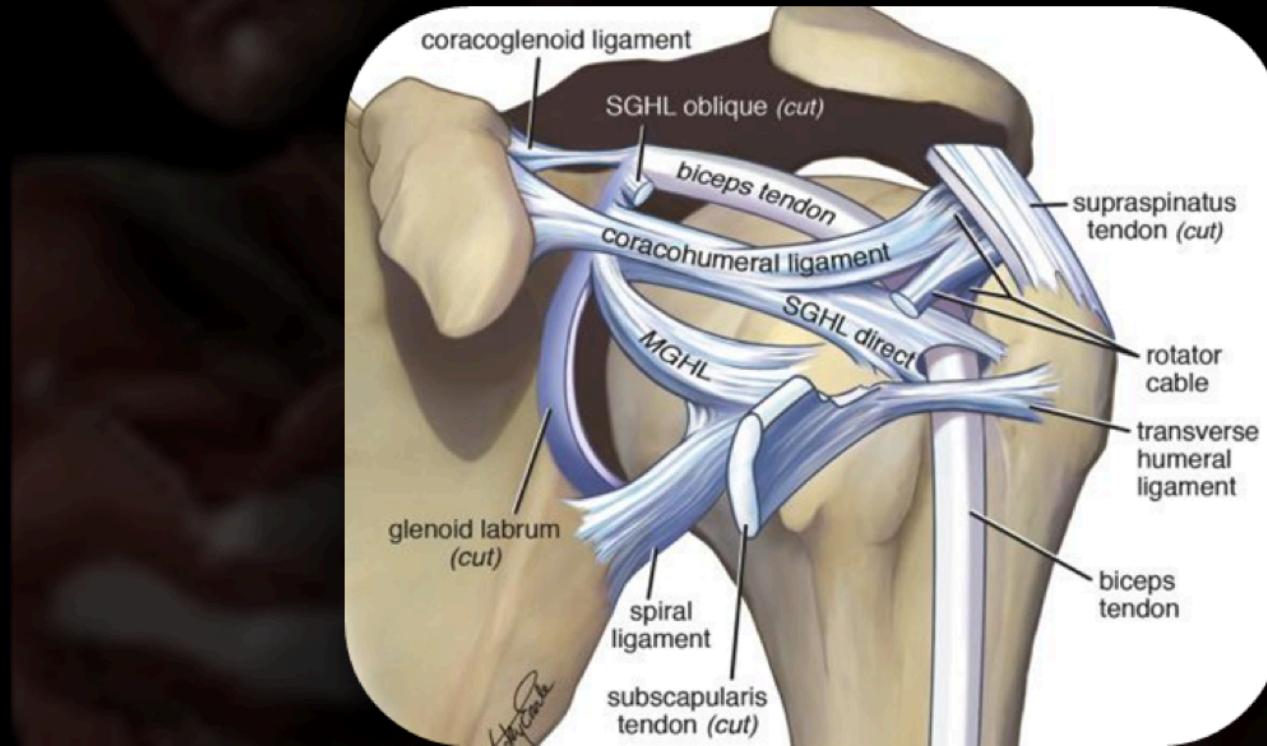

Introduction

Biceps pulley

'Direct' fibers of the Superior glenohumeral ligament (SGHLd) & Subscapularis

Biceps pulley lesions are a cause of anterosuperior shoulder pain

Isolated superior glenohumeral ligament injuries can progress to rotator cuff tears

Treatment of pulley lesions

JOURNAL OF
SHOULDER AND
ELBOW
SURGERY

**Arthroscopic prevalence of pulley lesions in 1007
consecutive patients**

Bernd Baumann, MD, Kathrin Genning, MD, Dirk Böhm, MD, Olaf Rolf, MD, and Frank Gohlke, PhD,
Würzburg, Germany

Biceps pulley lesions can be treated

Treatment of pulley lesions

Incidence = 7%

Pulley lesions are progressive

Early surgical treatment available

Electrothermal treatment

Primary reconstruction

Long head biceps tenodesis

SGHld = Superior Glenohumeral ligament, direct. LHBT = Long Head Biceps Tendon

Embryology

Mesenchyme surrounds the humeral head

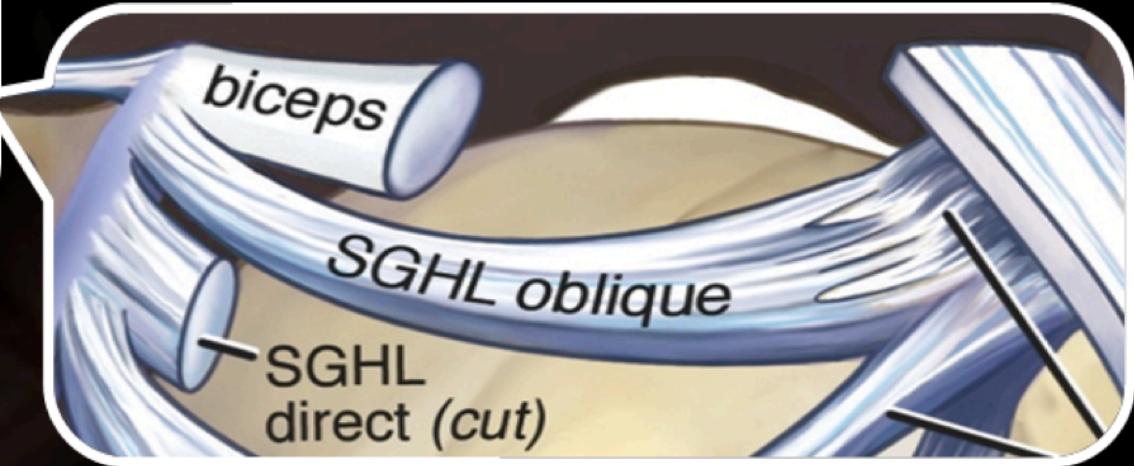

Rotator cuff tendons propagate through the mesenchyme to reach humerus

Mesenchyme matures to become the capsular ligaments

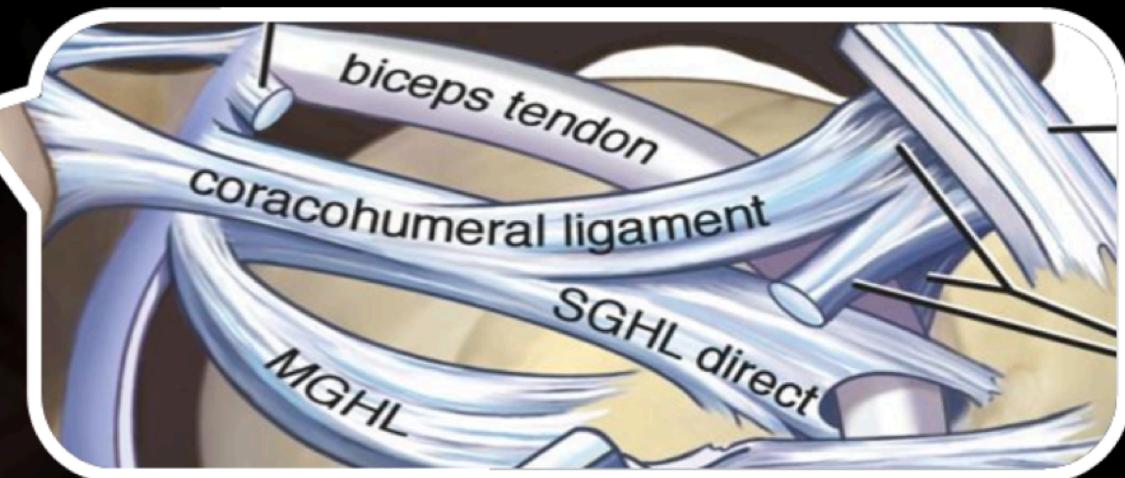

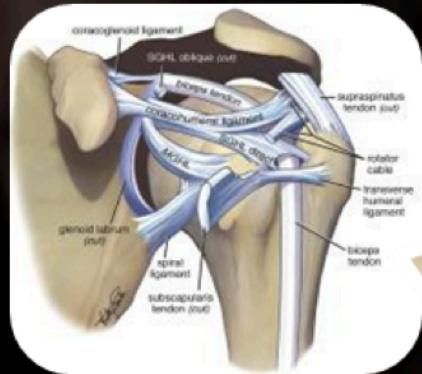

Abe S, Nakamura T, Rodriguez-Vazquez JF, Murakami G, Ide Y. Early fetal development of the rotator interval region of the shoulder with special reference to topographical relationships among related tendons and ligaments. *Surg Radiol Anat*. 2011 Sep;33(7):609–15.

Biceps pulley - anatomy

Superior Glenohumeral Ligament, oblique
Supraglenoid tubercle >> rotator cable

Biceps pulley - anatomy

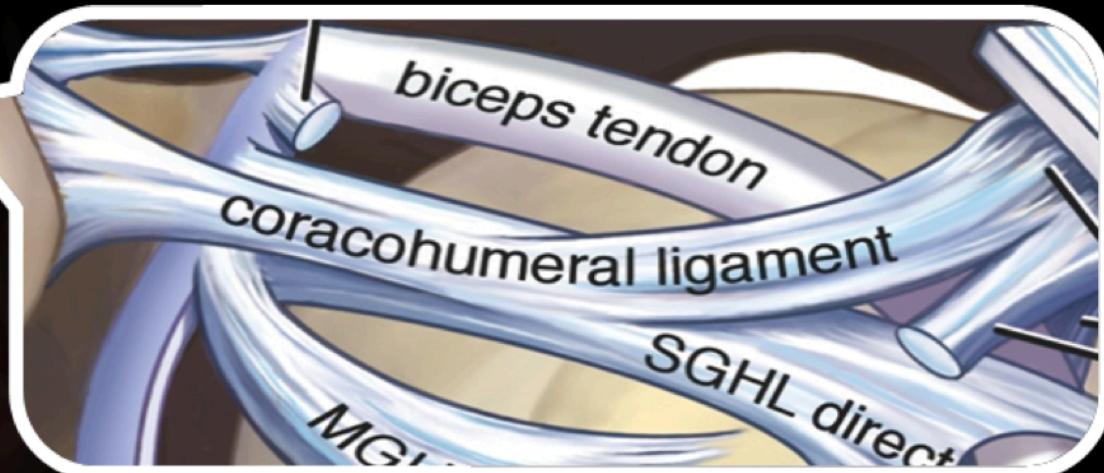

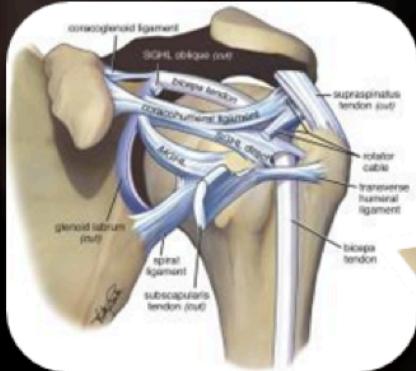

Superior Glenohumeral Ligament, direct
Anterosuperior labrum >> humerus

View from the axilla, looking superiorly

Biceps pulley - anatomy

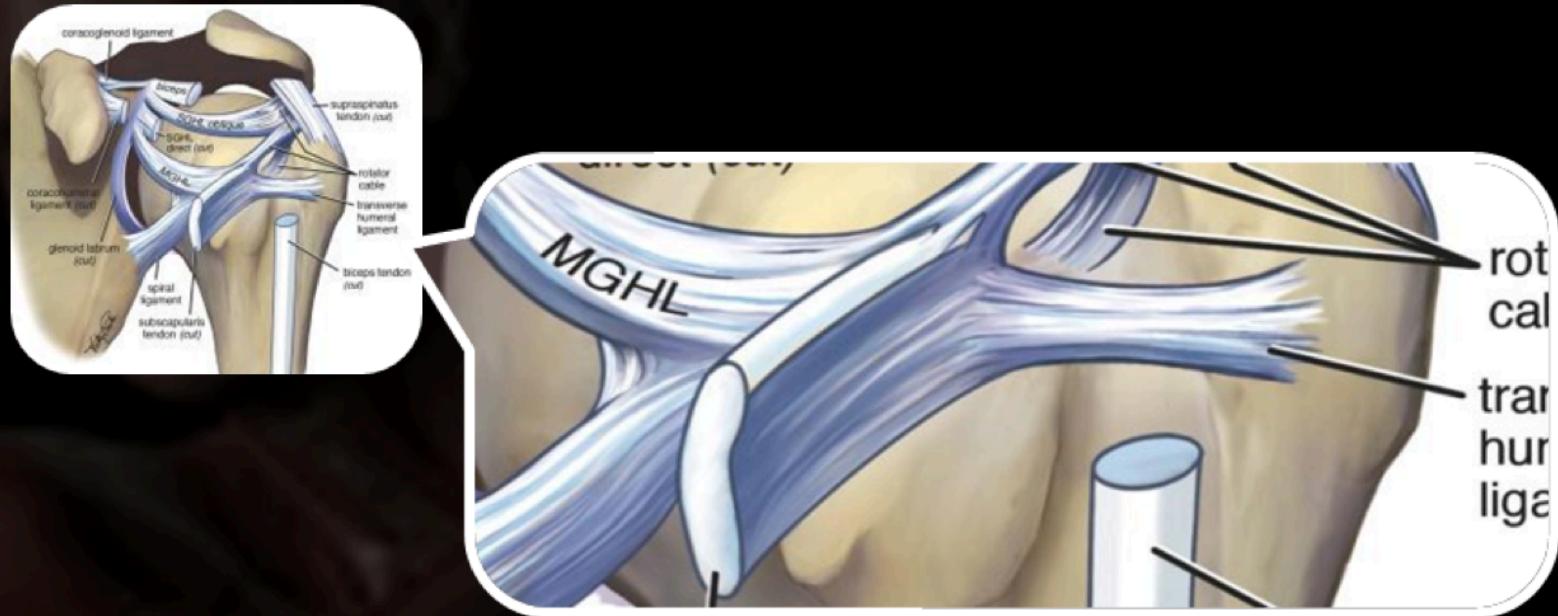

Coracohumeral ligament

Coracoid >> rotator cable

Blends loosely with the direct component of the superior glenohumeral ligament at mid-interval and continues to the rotator cable, not the humerus

Biceps pulley - anatomy

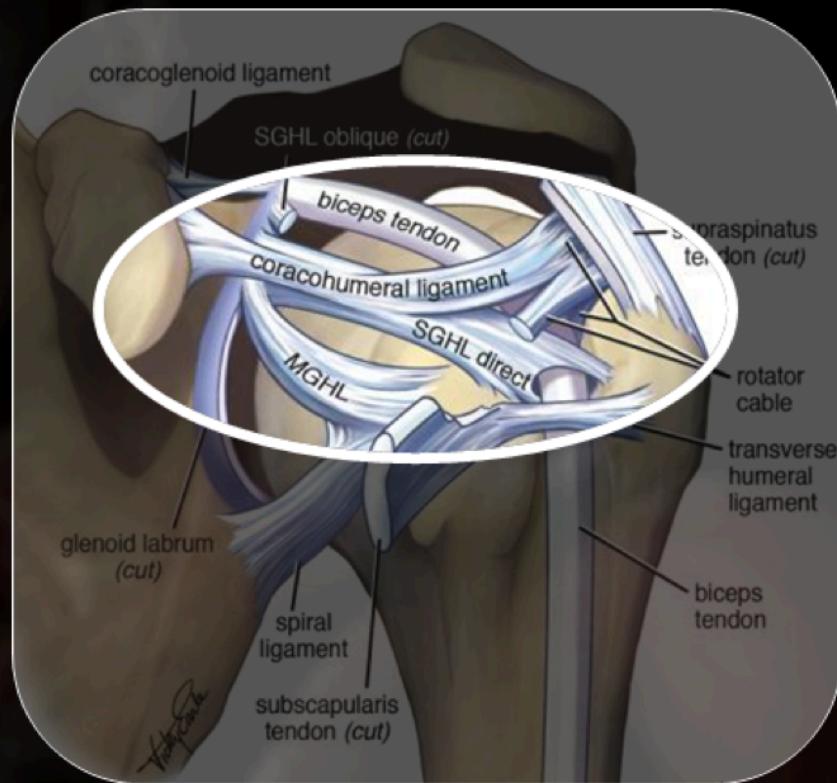

Subscapularis

Supports the Superior glenohumeral ligament and forms the transverse humeral ligament

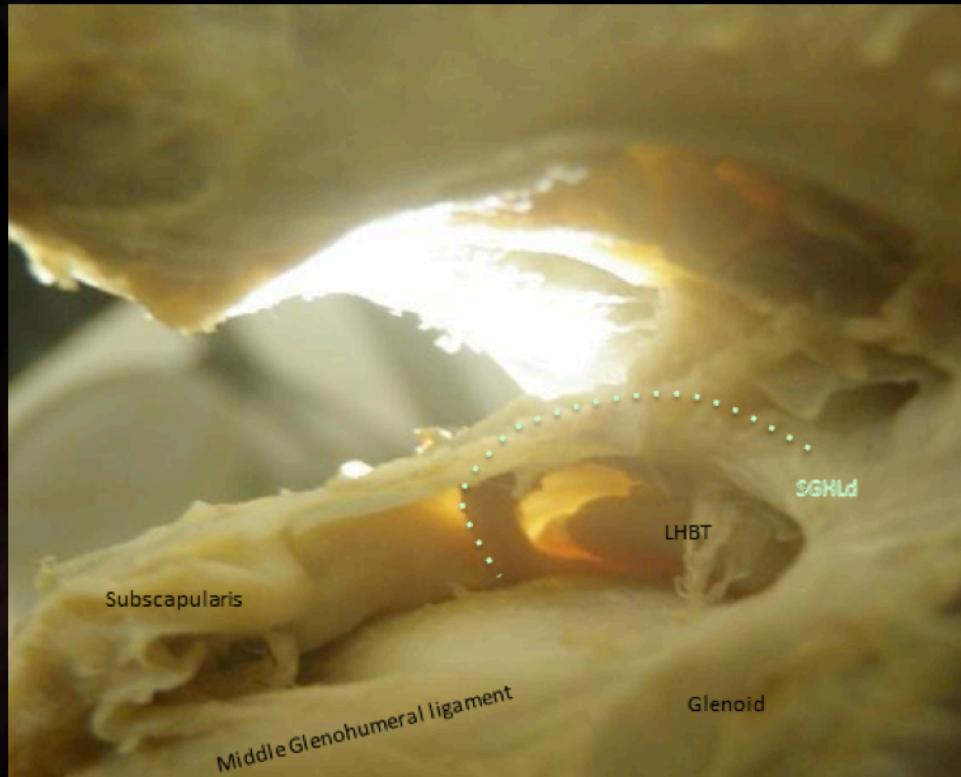

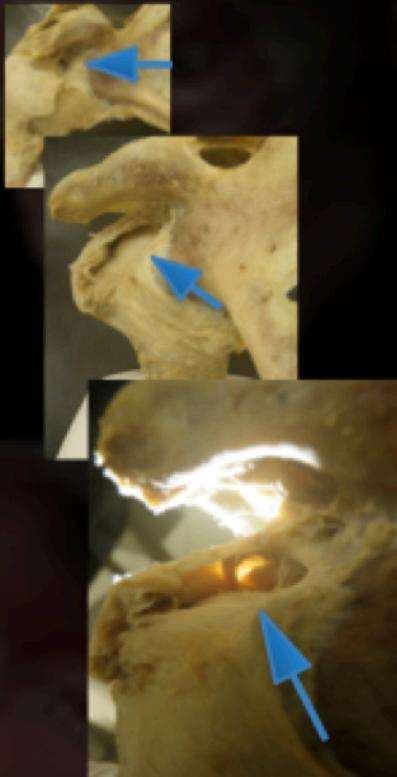

Arai R, Mochizuki T, Yamaguchi K, Sugaya H, Kobayashi M, Nakamura T, et al. Functional anatomy of the superior glenohumeral and coracohumeral ligaments and the subscapularis tendon in view of stabilization of the long head of the biceps tendon. *Journal of Shoulder and Elbow Surgery*. 2010 Jan; 19(1):58–64.

Biceps pulley and rotator interval

Biceps pulley = 'direct' component of the superior glenohumeral ligament & Subscapularis
The coracohumeral ligament blends loosely with the SGHL direct and continues to insert into the rotator cable. I.e. NOT a primary component of the biceps pulley

Biceps pulley – anatomy; medial

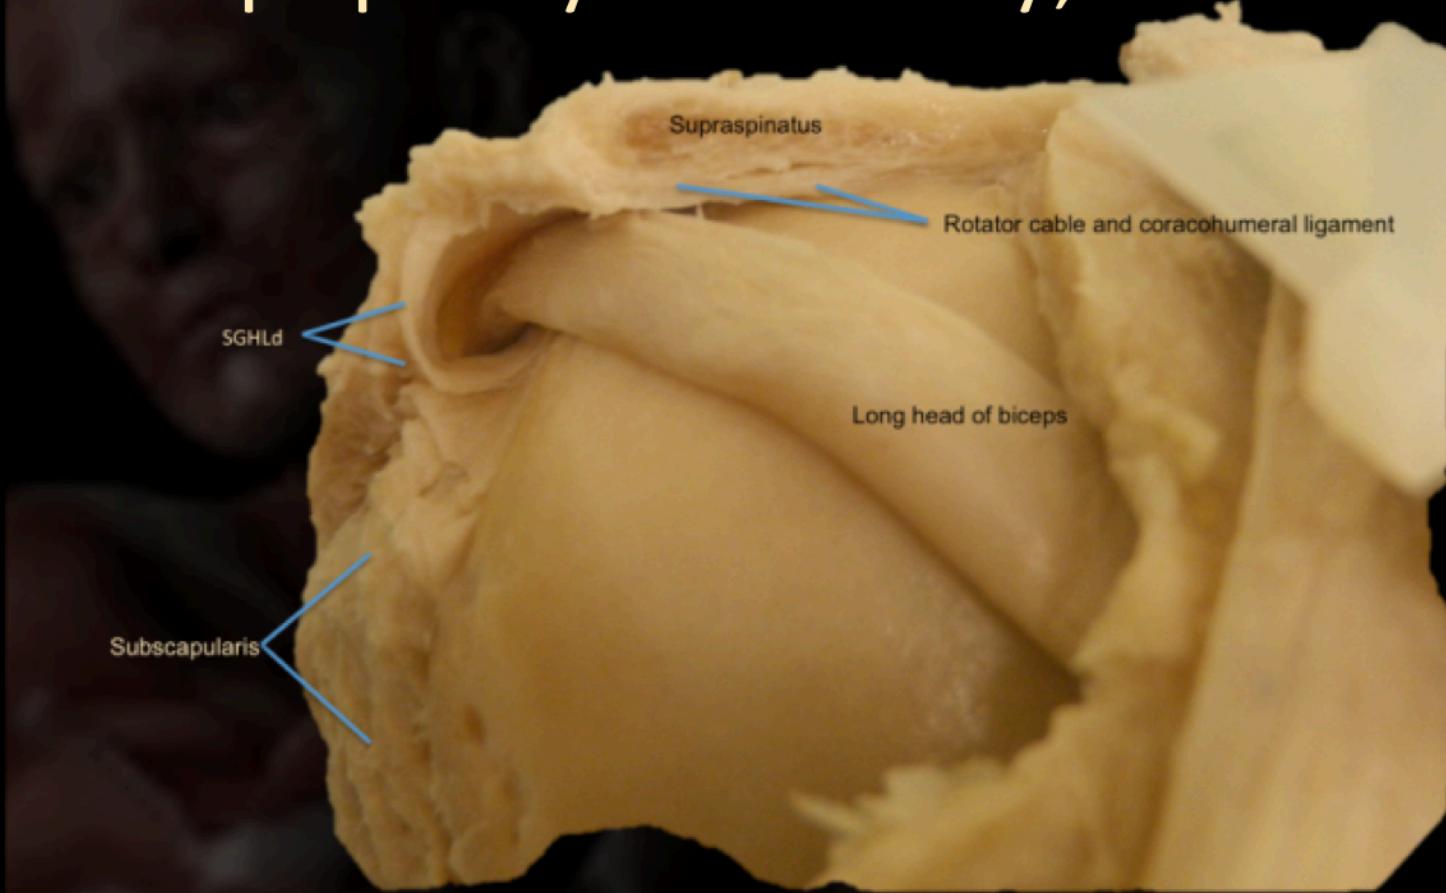

SGHld = Superior Glenohumeral ligament, direct. LHBT = Long Head Biceps Tendon

Superior glenohumeral ligament is discrete

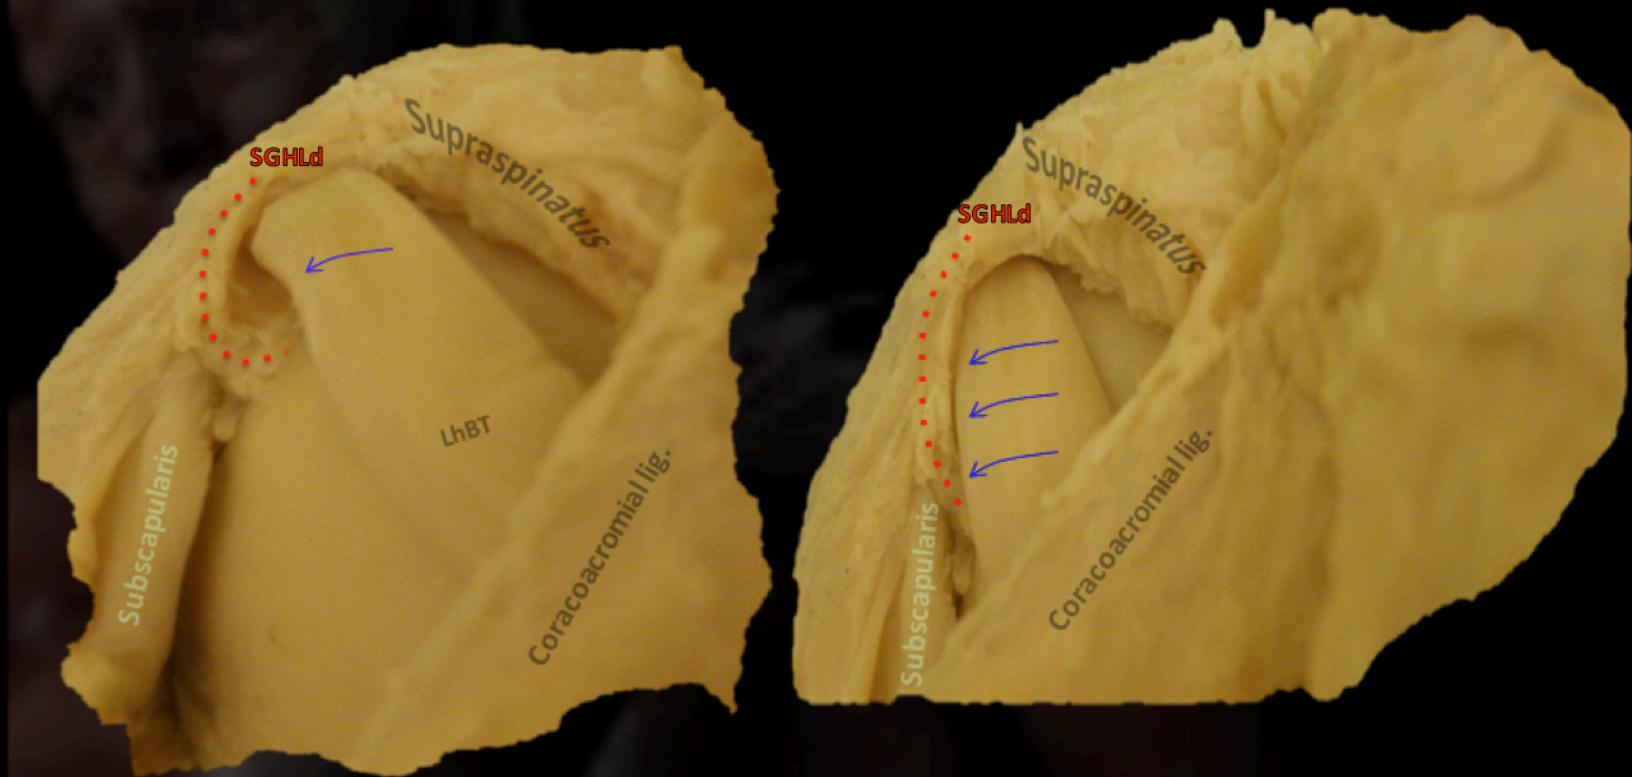

Arises from the anterosuperior labrum and spirals under the biceps

Biceps pulley – anatomy; lateral

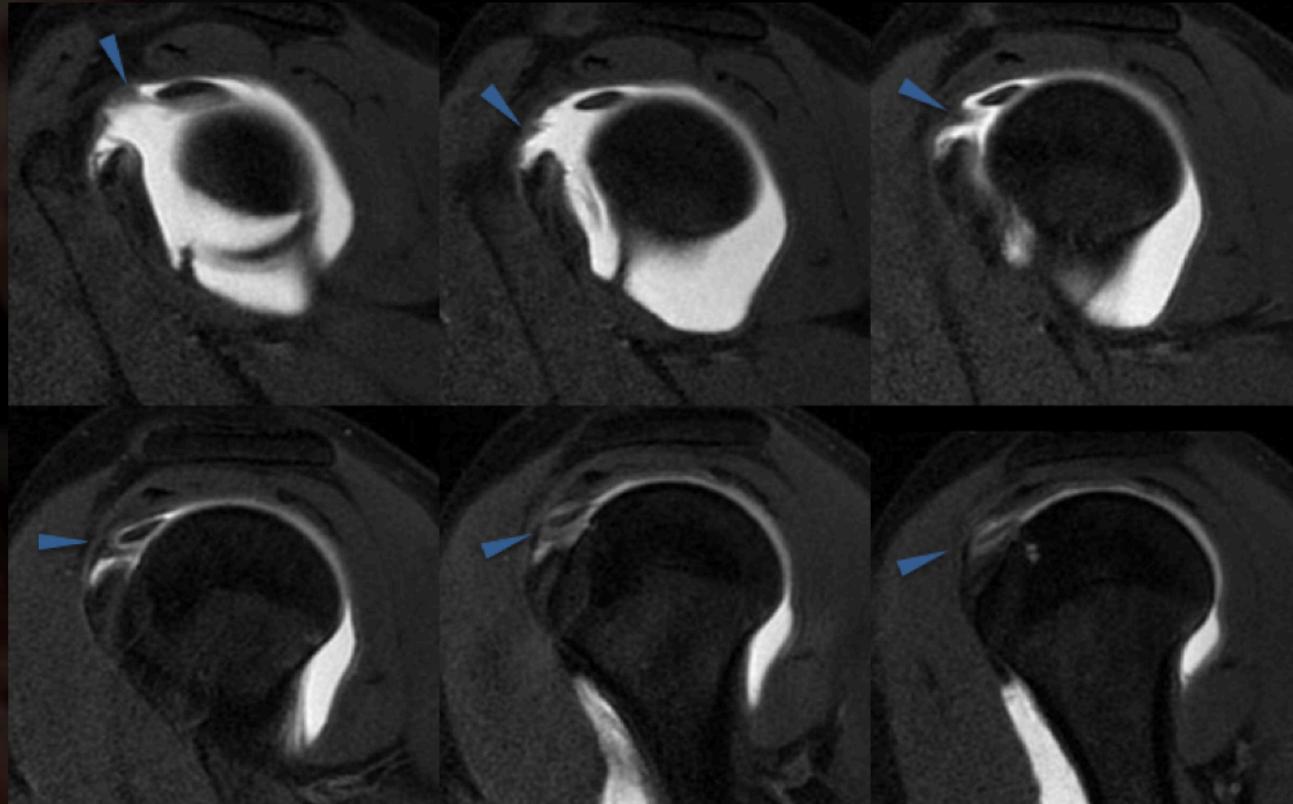

Superior glenohumeral ligament spirals under the longhead of biceps tendon
Coracohumeral ligament inserts into the rotator cable, not the humerus

Biceps pulley – ‘pulley concept’

The pulley prevents anteroinferior translation of the biceps

Biceps pulley – arthrogram

Superior glenohumeral ligament, direct component
Critical and visible

Biceps pulley – injury and diagnosis

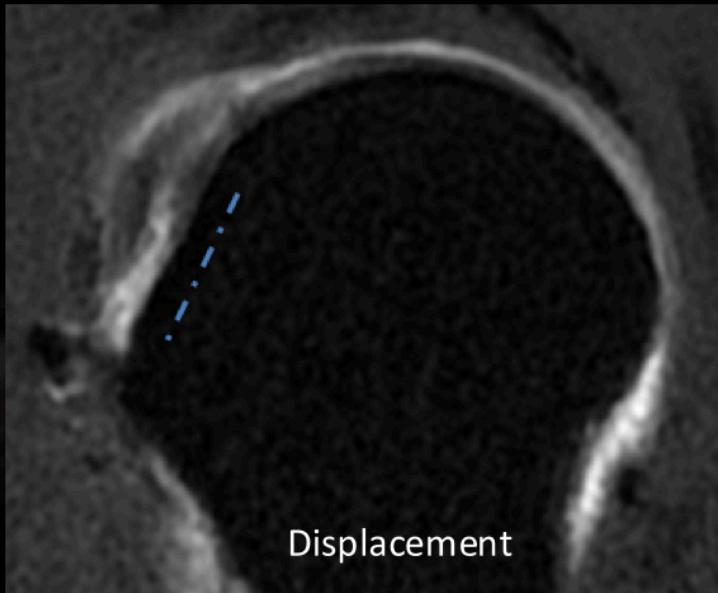

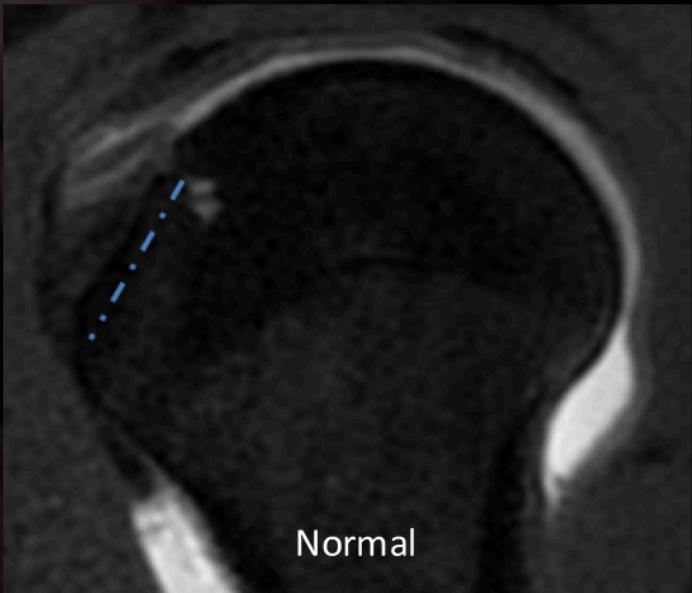

Lesions of the Biceps Pulley:

Diagnostic Accuracy of MR
Arthrography of the Shoulder and
Evaluation of Previously Described
and New Diagnostic Signs¹

Radiology

Schaeffeler C, Waldt S, Holzapfel K, Kirchhoff C, Jungmann PM, Wolf P, et al. Lesions of the Biceps Pulley: Diagnostic Accuracy of MRArthrography of the Shoulder and Evaluation of Previously Described and New Diagnostic Signs. *Radiology*. 2012 Jul 20;264(2):504–13.

Biceps pulley – injury and diagnosis

Displacement sign;

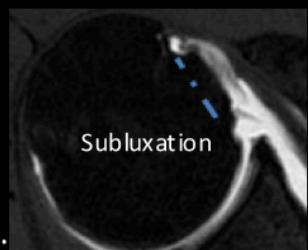

Mid-point of lesser tubercle in sagittal plane

Biceps tendon displaces inferiorly

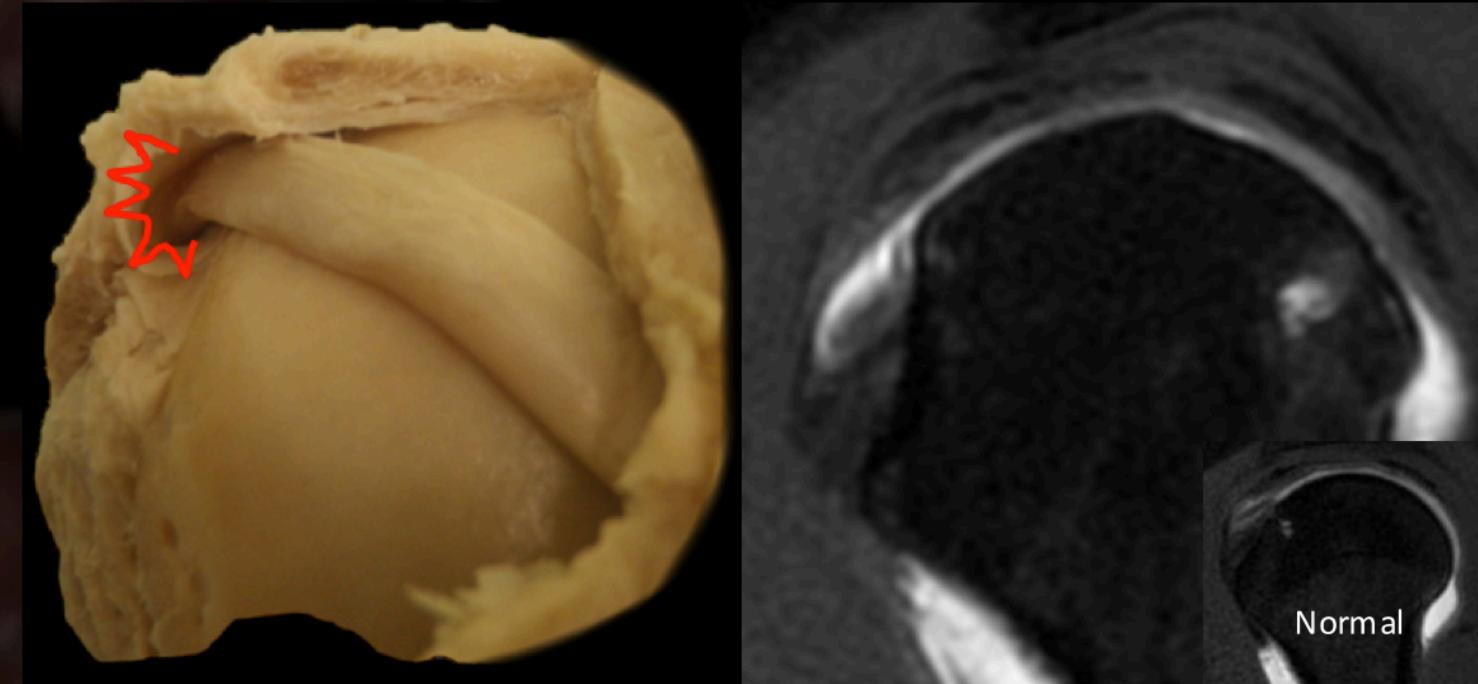

Three readers; Sensitivity = 86%, 82%, 75%. Specificity = 96%, 98%, 90%.

Subluxation of biceps tendon on axial images;

Three readers; Sensitivity = 36%, 50%, 64%. Specificity = 100%, 98%, 96%.

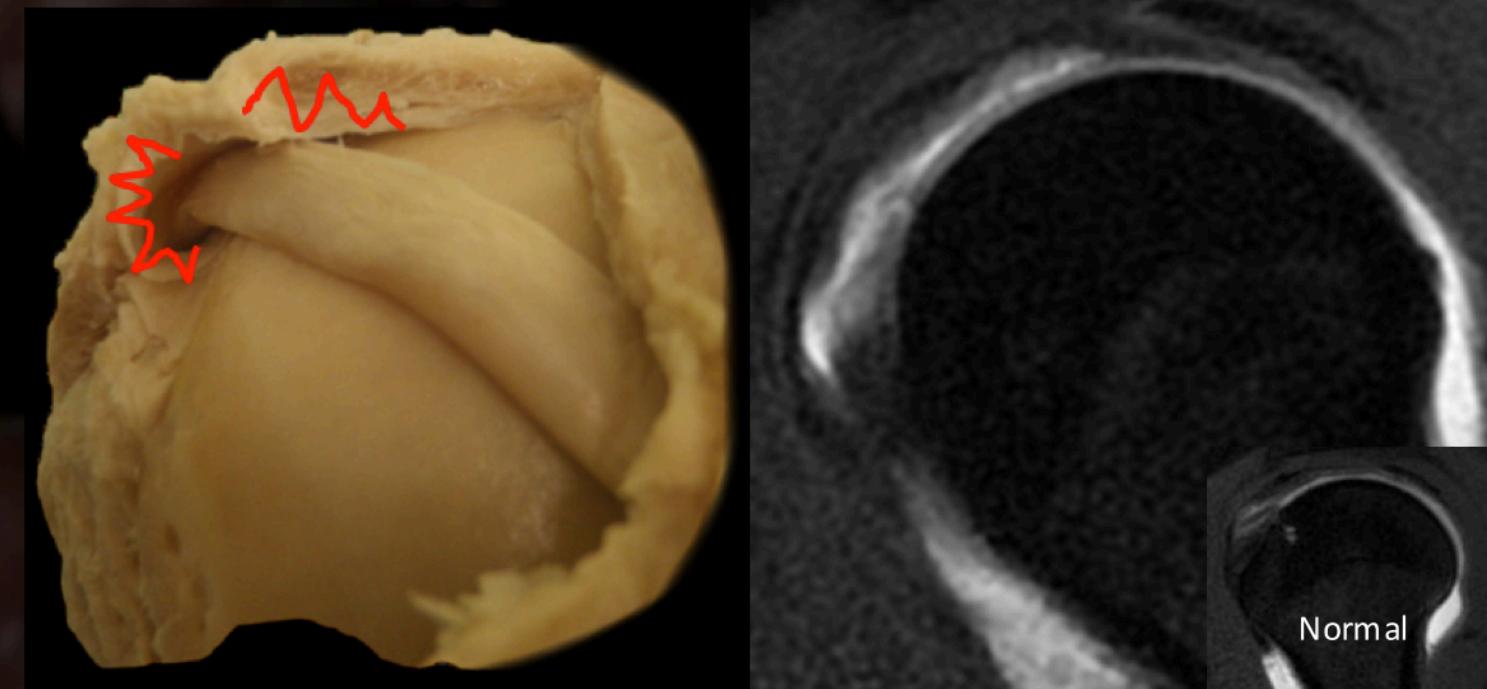

Pulley injuries – Habermeyer type I

Superior glenohumeral ligament

Habermeyer P, Magosch P, Pritsch M, Scheibel MT, Lichtenberg S. Anterosuperior impingement of the shoulder as a result of pulley lesions: a prospective arthroscopic study. J Shoulder Elbow Surg. 2004 Jan;13(1):5–12.

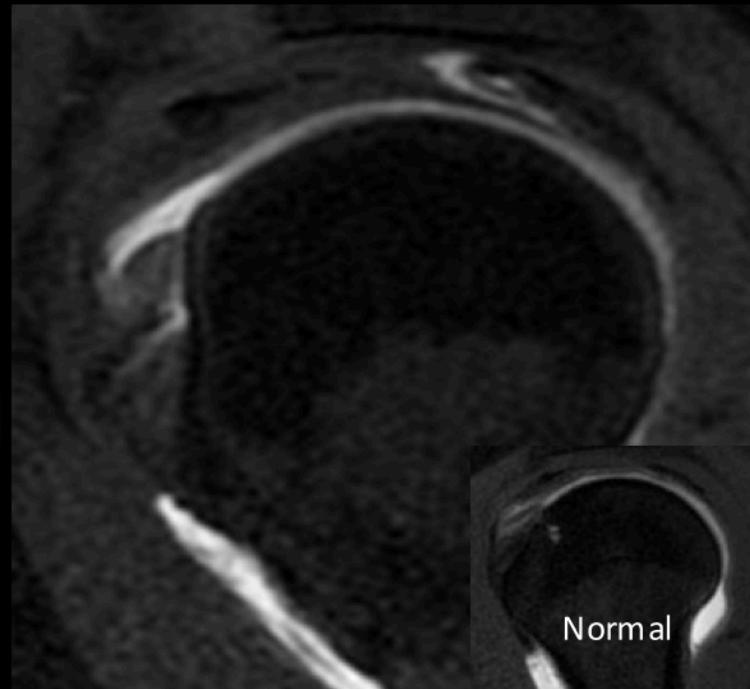

Pulley injuries – Habermeyer type II

Superior glenohumeral ligament + Supraspinatus

Habermeyer P, Magosch P, Pritsch M, Scheibel MT, Lichtenberg S. Anterosuperior impingement of the shoulder as a result of pulley lesions: a prospective arthroscopic study. J Shoulder Elbow Surg. 2004 Jan;13(1):5–12.

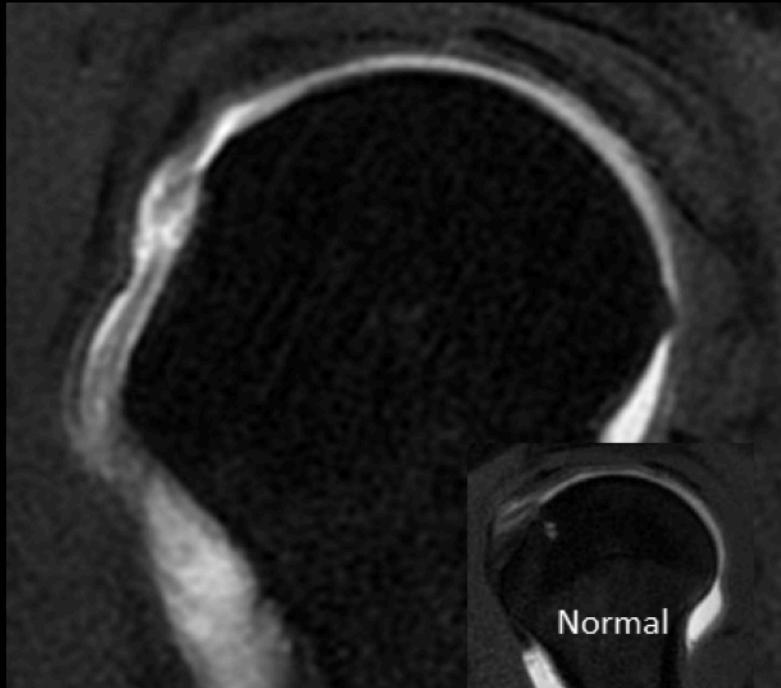

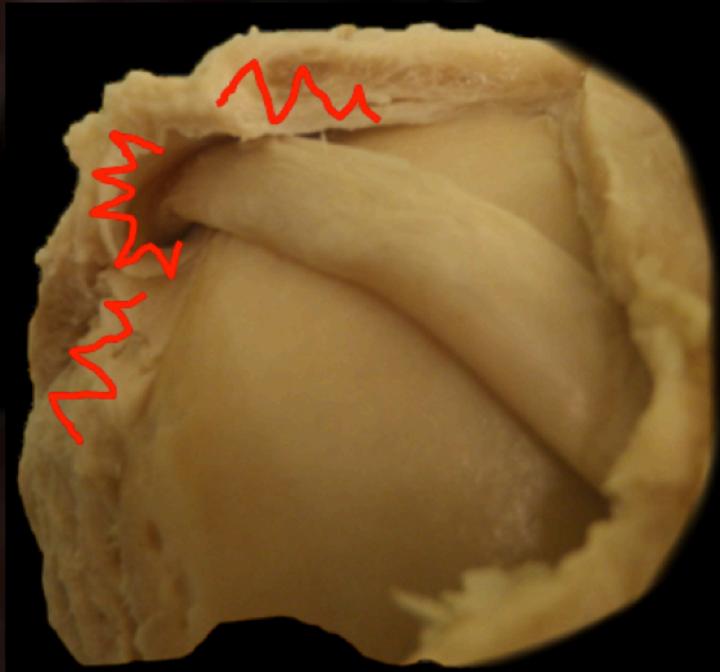

Pulley injuries – Habermeyer type III

Superior glenohumeral ligament + Subscapularis

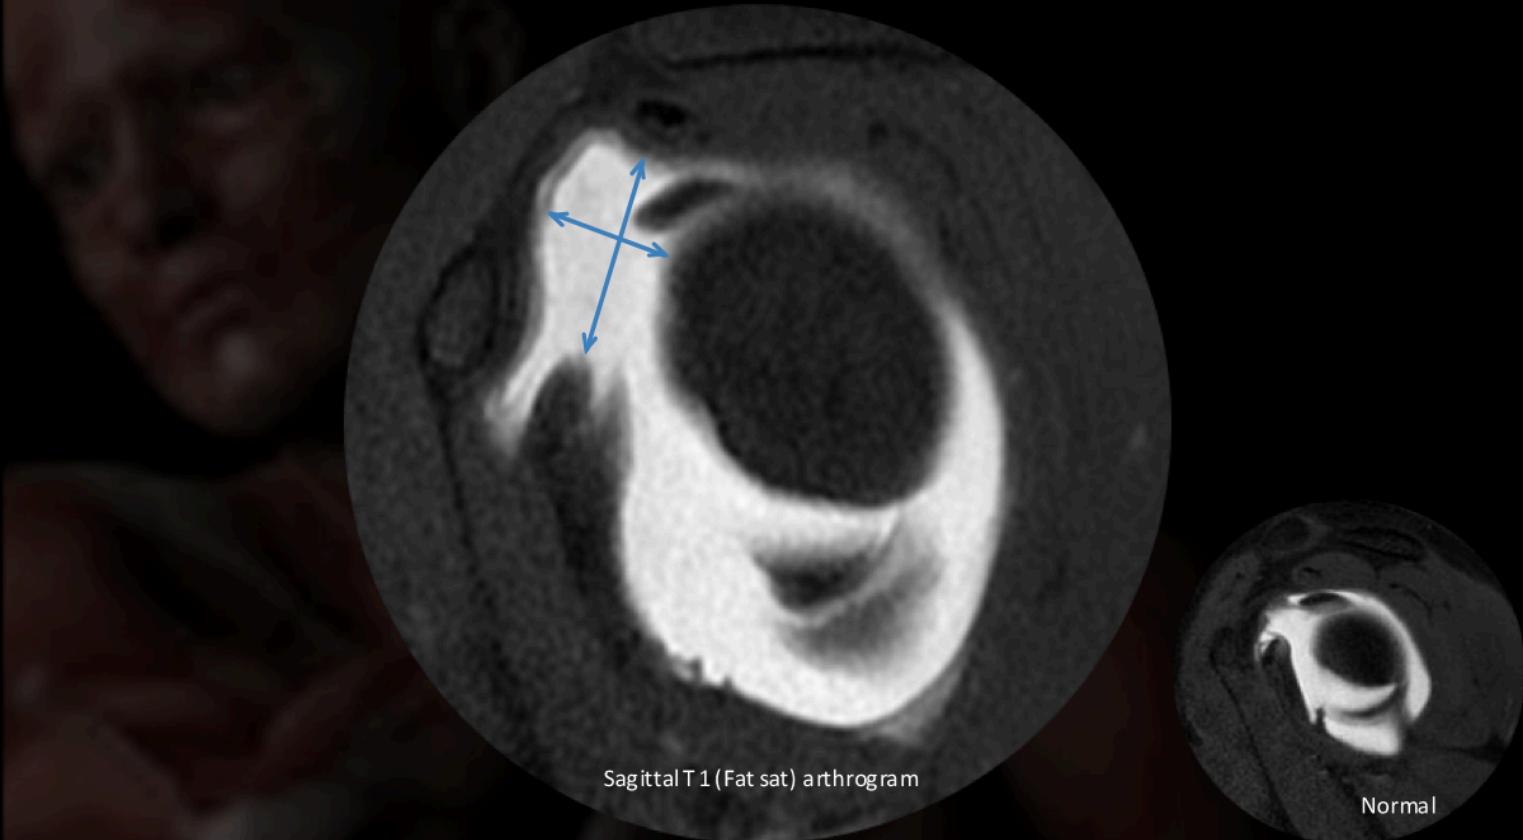

Habermeyer P, Magosch P, Pritsch M, Scheibel MT, Lichtenberg S. Anterosuperior impingement of the shoulder as a result of pulley lesions: a prospective arthroscopic study. J Shoulder Elbow Surg. 2004 Jan;13(1):5–12.

Pulley injuries – Habermeyer type IV

Superior glenohumeral ligament + supraspinatus + subscapularis

Rotator interval – capsular laxity

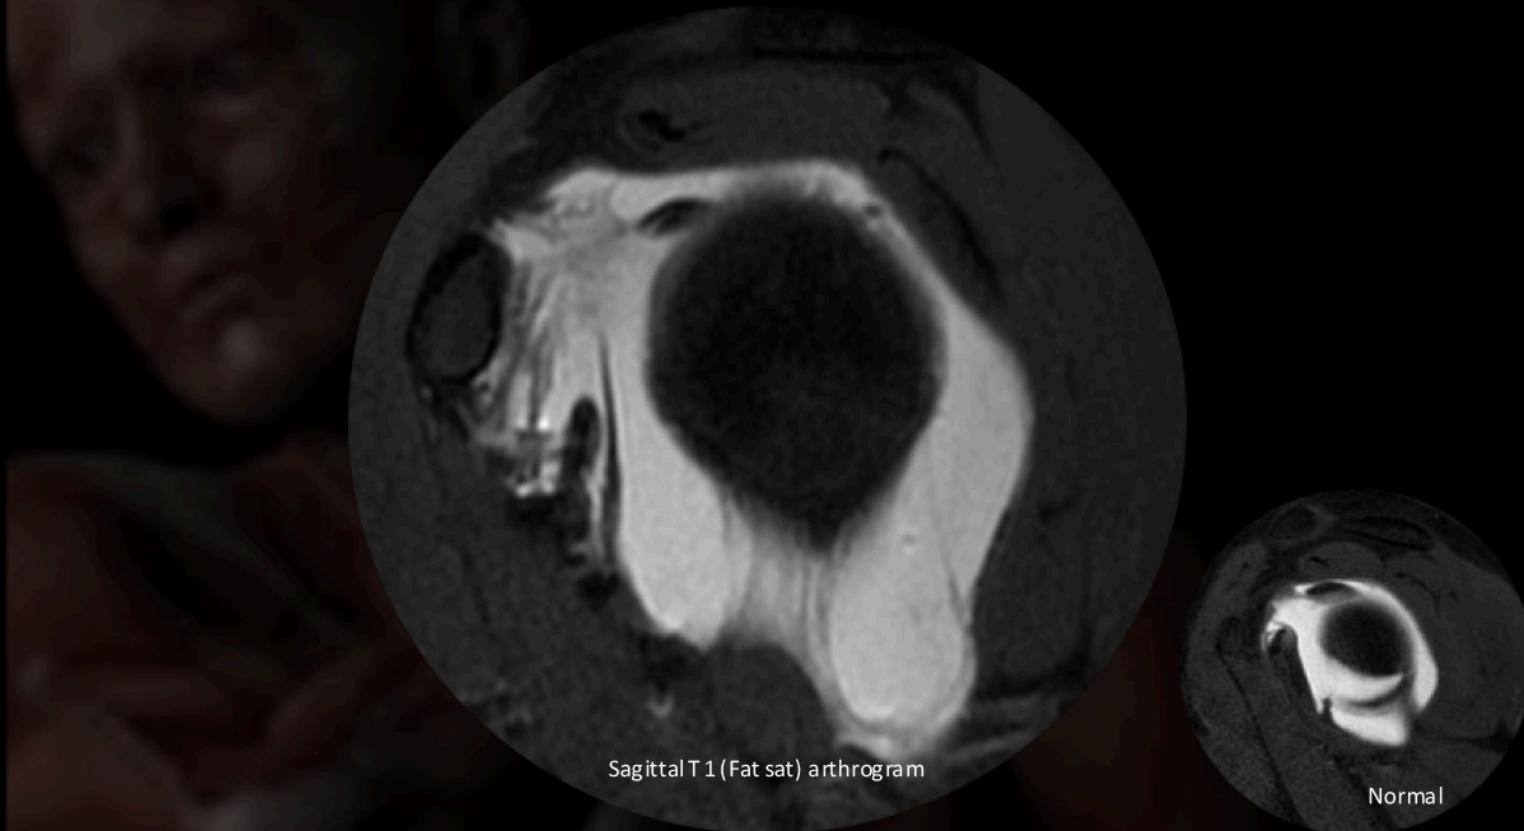

Capsular laxity and Multidirectional instability

Width greater than 15.2 mm (Subscapularis to supraspinatus)

Depth greater than 6.4 mm (Humeral head to roof of interval)

Sensitivity = 81%, 92%, 79%, 94%. Specificity = 66%, 72%, 62%, 66%.

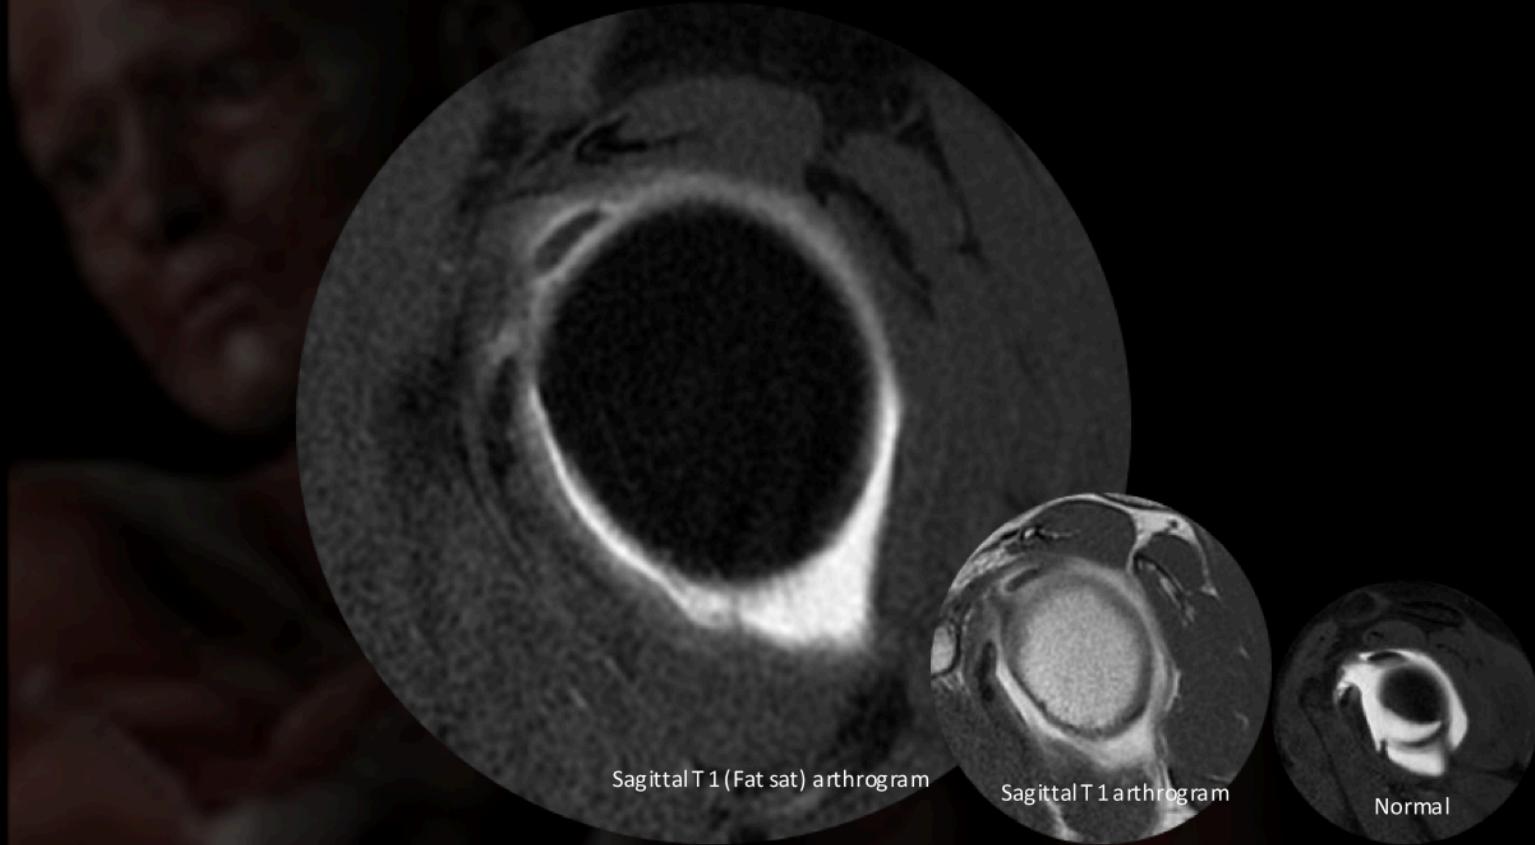

Rotator interval – interval tear

Widened interval

Contrast contacting the posterior coracoid cortex

Rotator interval - adhesive capsulitis

Interval obliterated

Loss of normal subcoracoid fat signal on T1 (non-Fat sat)

Summary

Understanding the rotator interval = ability to identify various pathology;

Pulley lesions

Capsular laxity and Multidirectional instability

Rotator interval tears

Adhesive capsulitis

'Biceps pulley' refers to the 'direct' component of the superior glenohumeral ligament and leading edge of the subscapularis

Coracohumeral ligament blends into the rotator cable

Isolated repair of the direct superior glenohumeral ligament can lead to improved clinical outcomes
